Success with GML?

- Flagship product OS MasterMap offered in GML only (November 2001).
- GML 2 that is.
- Translation software was not fit for purpose at that state.
- Commercial perspective: customer's want what's easiest for them and a big data management change was met with resistance.

Egmont Point

- Long customer migration process until 2006/7: stick and carrot.
- Currently offer beta-version of one product in GML 3 to solicit market feedback.
- Big push towards GML 3 anticipated with Inspire.

St Aldhelm or St Alban's He

Egmont

Do users want to use GML?

Egmont Point

YES

NO

Lookout Sta

So what's wrong with GML 3?

Egmont Point

- Covers everything.
- Everybody is creating profiles and application schemas based on their own rules/interpretations.
- Simple features profile is a common ground but what do I do I need simple features and a little bit extra.
- Is it difficult to implement?
- Is it difficult to understand?

Bottom line: It is globally still not the widest used "format" for geographic information. (though statement lacks evidence)

St Aldhelm or St Alban's He

New Product Development @ OS

GML working group at OS.

Have looked at a small portfolio of strategic formats, including

Egmont Point

- GML3.2 / CityGML / variety of application schemas
- RDF/XML
- GeoTIFF
- JPEG2000/GML
- CSV, XML
- Vendor-specific formats in special situations

Long term view (data preservation, archiving) very similar to this. St Aldhelm or St Alban's He

- Need for "GML/A", "19115/A"
- and stronger integration of the two

If we were to introduce GML 4 (hypothetical)

Assumption: GML 4 might be ready by December 2013

Egmont Point

- Work with system suppliers throughout 2014 to agree support
- Publish first product by end of 2014 (But which ones?
 Maybe we should wait a few more years)
- Figure out if it makes sense/if we need to run GML3 and 4 in parallel. if not completely migrate customers for this first product by end of 2020
- Other products to follow suit

Verdict: Migration to a new data format/encoding may take a very long time.

St Aldhelm or St Alban's He

A plea to software suppliers

Any requirements in a non-backwards compatible GML 4 are fine

if system suppliers can guarantee that GML versions are invisible to customers (they don't need to care about this —it just works).

Egmont Point

Please talk to each other and influence GML 4 so that implementation in software really becomes quicker and easier.

St Aldhelm or St Alban's He

Considerations

- What does it mean to be GML compliant?
- Inspire is a big push for GML 3.2 for big providers as well as for smaller producers (Annex III)

Egmont Point

- Web Service integration is important (shift from content to access and further use)
- Modularisation is important
- Are there any "SDI 2.0" requirements? (TC/211, Inspire community)?
- Parallel running of GML 3 and 4
 - Still new requirements into 3.x?
 - Costly to maintain two in parallel for OGC, vendors, data suppliers and users if there isn't a good enough differentiatior.

Lookout Sta

Considerations 2

- Inclusion of styling. Or is KML the only alternative?
 Perhaps
 at least the basis, like colours and simple line-styles.
- Easier integration of registered items such as codelists.

Egmont Point

- Have some simple rules that other communities can utilise to encode geography. Allow pick and mix.
- Rely on 19109? Or be more open?
- Separate semantic (feature) model from geometry encoding?
- Stronger **temporal characteristics** needed.

St Aldhelm or St Alban's He

Chapman's

Egmont Point

Atom, JSON, RSS, ...

- Ahhhhh.
- Modularise to make it easy for other user communities to include bits into their standards (we've already done this: GML can be put into JP2, RDF/XML, etc.)
- Push GML 4 as the universal geographic encoding on the web: true plug-and-play.
- GML is KML is RDF is ARML is
 Integrate by providing a common, very open platform that connects effortlessly.

Lookout Sta

Recommendations (do not)

Egmont Point

It is **NOT** worth doing GML4 if

- it is mainly a modularised GML 3, it (you can still create modularised application schemas, a la CityGML).
- requirements can mainly be covered by strongly supported,
 community-specific profiles of GML 3.
 - ► think cadastre, topography, certain environmental domains, etc. as well as Inspire profiles.
- the main customer target is the SDI market, particularly in Europe.

Lookout Sta

Differentiator?

What could it be in GML 4 that makes it worth having next to GML 3?

Or in fact SHP and others?

St Aldhelm or

St Alban's He

Lookout Si

Recommendations (do)

 Get the balance right between new requirements and simplicity/ease of use.
 A very big GML 4 that is very complex in total and only

made simpler through modularisation isn't going to cut it.

Egmont Point

- Create a proposition that works rather than adding more functionality based on CRs.
- Focus on the benefit of GML 4 and why it will become a must have.
- Target the **emerging markets**, AR, gaming, social networking, all IETF and w3c stuff, etc.
- Modularisation / pick and mix is a good goal if it opens up new opportunities and has the potential to unify geography encoding across the web.
- Include some rendering stuff (see CityGML).
- Introduce separate namespaces.
- Integration of coverages could make sense.

Lookout Sta

Vision for GML 4

GML 4 will be the data encoding that everybody on the web and in backend systems will use to represent geographic (vector) data. Extensions will be strongly driven by the relevant communities.

Egmont Point

Discuss.

Start with a set of principles on how to used GML 4.

Lookout Sta

Recommendation

Differentiate GML 4 from GML 3 and other common encodings and allow it to be easily utilised by other data communities on the web.
